

COMPARATIVE STUDY OF TSH-CHECK-1 (THYRO-Check®) RAPIDTEST USING PRE-ASSAYED SERUM AND WHOLE BLOOD SAMPLES FOR THE DETERMINATION OF A POTENTIAL MATRIX EFFECT.

I. Purpose

This study was performed to determine whether TSH-CHECK-1 rapid test (THYRO-Check®) shows potential matrix effect using a panel of TSH pre-assayed samples by reference methods (ROCHE Cobas 8000 and BIOMERIEUX VIDAS).

II. Method

This study was performed on December 12th, 2017 using material indicated in Table 1.

Components	Lot
TSH-CHECK-1 Test (THYRO-Check®)	161028-027
Diluent	27107-02
TSH pre-assayed serum panel	071217

Table 1: Components

A panel of 105 TSH pre-assayed serum samples has been tested using TSH-CHECK-1 rapid test (THYRO-Check®).

At the same time, plasmas of negative TSH whole blood samples have been removed after centrifugation and replaced V/V by pre-assayed serums.

These samples have been tested using TSH-CHECK-1 qualitative test (THYRO-Check®) as per the procedure indicated in Table 2.

(Samples 1 to 60 using EDTA whole blood, and samples 22903758 to 24573626 using Citrated whole blood)

Protocol	
Sample	25 µL of serum or 50 µL of whole blood
Diluent	150 µL
Reading time	10 minutes

Table 2: Protocol

III. Results

The results are indicated in Table 3.

Status	Sample	Gender	Age (years)	Origin	Method	TSH concentration (µUI/mL)	Results TSH-CHECK-1

Table 3: Results obtained using a panel of TSH pre-assayed samples

IV. Diagnostic specificity and sensitivity

The results are summarized in Table 4 (serum matrix) and Table 5 (Whole blood matrix).

TSH-CHECK-1 (THYRO-Check®)	Reference panel		
	-	+	Total
-	39	1	40
+	1	64	65
Total	40	65	105

Table 4: Results obtained with serum samples

TSH-CHECK-1 (THYRO-Check®)	Reference panel		
	-	+	Total
-	39	1	40
+	1	64	65
Total	40	65	105

Table 5: Results obtained with whole blood samples

Diagnostic specificity: $(39/40) \times 100 = 97.5\%$

Diagnostic sensitivity: $(64/65) \times 100 = 98.46\%$

Overall correlation: $(39+64)/105 \times 100 = 98.1\%$

V. Conclusion

This study shows that there is no difference of result interpretation between the results obtained with sera samples and those obtained with whole blood samples. Therefore, there is no matrix effect on TSH-CHECK-1 qualitative test (THYRO-Check®).

The diagnostic specificity, the diagnostic sensitivity and the overall correlation of TSH-CHECK-1 qualitative test (THYRO-Check®) are respectively of 97.5%, 98.46% and 98.1% compared with reference methods and using serum or whole blood samples.
